order19 RESULTS
PREREG sha256 c4a157be7820fc55854fdf1ea532cf4f6dfbeb3cbbfc0877e483fd14cced2ba9 (hashed before numerics; c fixed = 0 by derivation; Map RG5 hashed).
test	value	verdict
C0 control (A0 fixed-M, absolute)	1.0e−14	PASS
L0 affine law, c = 0 (absolute ‖R‖_F)	54.4 (rel 0.0586; ‖S‖ = 928)	**FAIL**
Corner reconstruction check	5.3e−13	ok
Map RG5: no part of A2_corner obeys a law (w = −1,0,1)	min abs 1.54	PASS (as stated)
Order18 pure w = $-\frac{1}{2}$, 0 FAIL reaffirmed by citation.
Category A
- c = 0 exactly (weight-one law ⇒ A0 terms cancel at t^0).
- Prop. O2 (paper: Prop. noaffine): any affine law with c·M·A0 on Q^× forces P-odd; A2c is P-even and nonzero ⇒ no such law for any c.
- Order18 RG3/RG4 now written to paper standard (v6 Thms A2odd, A2even, A2exact).
Paper
RTA_FOUNDATION_BOUND_v6.pdf, 131 pages.

order19 NOTES
- c was derived, not fitted; the derivation gives c = 0, so L0 coincides with order18's w = −1 law without the free scalar (order18 r = 0.058 with κ fitted ≈ 0.998). Disclosed: the outcome was largely foreseeable from order18.
- Post-hoc observation (not tested): the B2(ρ2/N) part comes closest to a w = 1 law (rel 3.1e−3); C2a at w=1 rel 2.1e−2. A candidate for order20, to be preregistered: a law for Bernoulli-weighted Gauss sums via the Fourier series of B2 (weights $1/k^2$).
- RG5 is a residual-internal negative statement; its PASS is not a bridge. No Resonant-side object used; E1–E3 OPEN. Framing stays opinion.
- v6 built because RG3/RG4 proofs were written to paper standard and Prop. O2 is new Category A, not because the affine law held.
- nice, OMP_NUM_THREADS=1, <3 GB; ~30 s run; no push/sends; new files only.
