order46 RESULTS: obstruction documented, no test run
PREREG sha256 in PREREG.sha256.
Verdict: no exact law for C2b inside the 54-dim Bernoulli-column span can be stated without fitting.
Reason: any fixed-matrix law is bounded below by the order38 floor r_B = 0.00206 > 0, so it is never exact. The exact laws we have (L_B (ii), LD0, the order45 x ↔ 1/x symmetry) are x-dependent, leave the span, or relate the wrong pair of points.
Consequence: an exact law for C2b (or the corner) must be x-dependent or must use objects outside the Bernoulli-column span, as L_B does. The "near-law" is a fixed-matrix shadow of the exact x-dependent L_B law.
Category: A: none. B: none (no numerics). v11: no. Ξ: not identified. E1–E3 OPEN.

order46 NOTES
- Closed: fixed-matrix exact laws for C2b (obstruction via the order38 floor).
- The productive route is order45's symmetry. Certify (ii) and (iii) exactly; then extend the symmetry to C2a, C11 and the full corner CO (preregistered predictions); then fold it into v11.
- Naming: RG* only, no labels L1–L7. MAPS_CANDIDATES untouched; no push or sends; CORE_FREEZE; new files only.
